The information in this document is distributed AS IS and the use of this information or the implementation of any recommendations or techniques herein is a customers responsibility and depends on the customers ability to evaluate and integrate them into the customers operational environment. This document and the information

Probable Cause: The cable attached to the ISL port "netappsw1(XXXXX)/port-channel1" with the description of "" might be faulty. For the port-channel, please check each individual link.

Possible Effect: Inter- or Intra- cluster redundancy might be lost.

Corrective Actions: 1) Check whether the cable is fully inserted into the interface port on both ends.

2) Reconnect the ISL port using another cable. After reconnecting it, verify whether the link of the ISL port is up by executing the commands per the switch configuration guide or by checking whether the Link status LED is on.
